

Established in Genoa during the 1960s as a special machines' manufacturer and repair workshop, in 1979, it took the name of LAMETER and focused its activity on the production of buckets for earth-moving machinery mainly in the Carrara (Italy) marble district. In 1989 LAMETER was taken over by Giuseppe Riccardi who, with his three sons, developed the company taking it from local market to the international arena increasing its turnover over the last 30 years. Currently the equipment produced, for **quarries** as well as for the **mining** industry, are sold **worldwide** (Europe, America, India, Russia, and Africa). LAMETER relies exclusively on the **most important steelworks** with which it is in constant contact in order to be up to date on new solutions. The production is manufactured with wear-resistant steel (HB 400-450-500) with high (STE690) and normal (S355J0) yield strength. The strength of LAMETER lies in rapid study and manufacturing of high quality, **customized attachments**.
